

Assignment 04

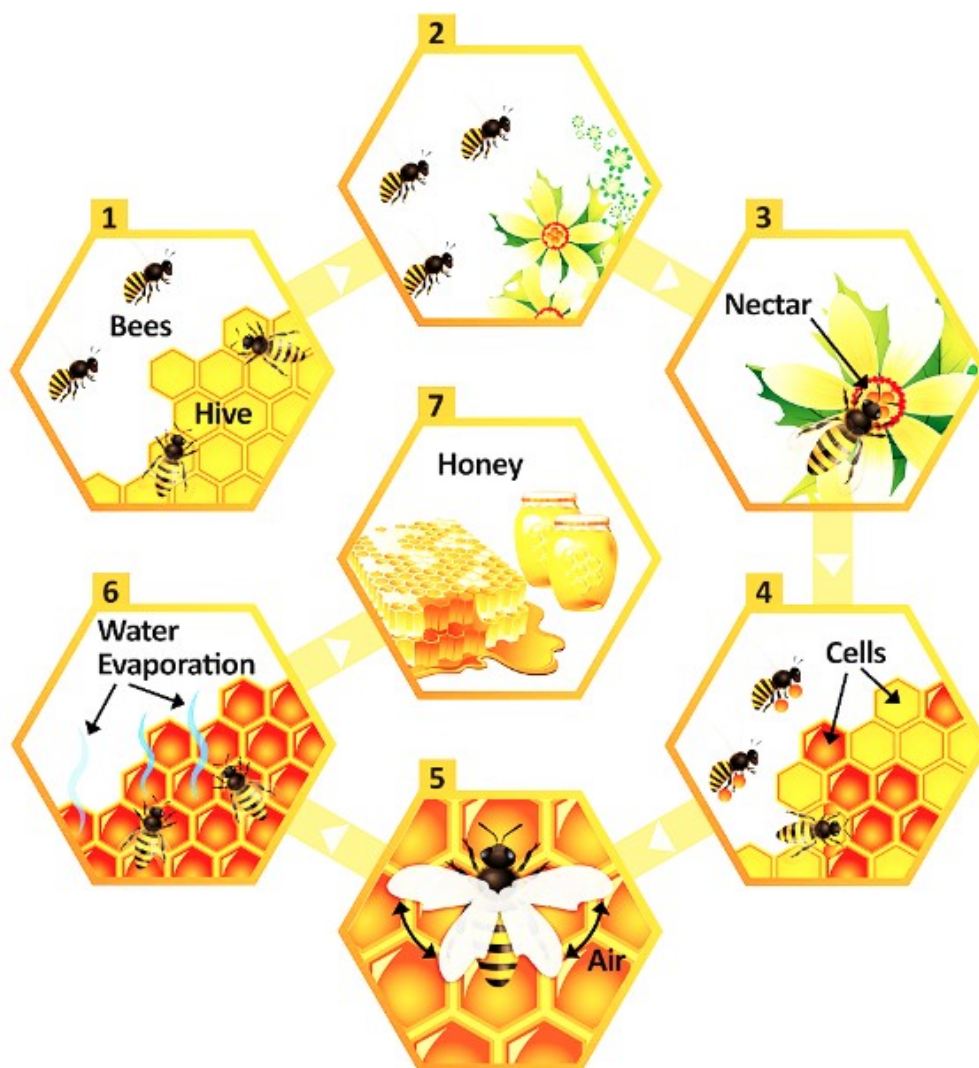

The histogram shows that the actual and the expected share of the Brazilian economy in five key industry sectors, as of 2009, 2019, 2029, and the year.

In 2009 and 2019, the Financing of Fossil fuels, the food industry, with a growth rate of about 5 per cent, of the first two, and roughly 10% of that of the other. However, the tourism sector, and the production declined by more than 5% during this period.

Only the finance sector is predicted to see a continued growth in 2029, again by 5%.

for the period covered, the Finance sector stands out in terms of having the largest share of brazil's economy and its share shows continued growth.

The chart shows the seven most important steps in the production of honey by bees. The process starts with the bees' honeycombs

are constructed, and the game ends when it is completed, the information is collected and used.

First, the bees have to build a container. This is called a hive and it consists of many individually built cells. second, the bees leave the hive in order to search for flowers. When they find a suitable flower, they collect the nectar from it, which is used to make honey.

The nectar is then taken back to the hive where the production process can begin. First, it is put into cells. Then, following this, the nectar must be cooled down. In order to do this, the bees fan the nectar-filled cells with their wings. As a result, the nectar loses its water content and then finally, the honey is produced.
